Ejercicios de Ecobici

En esta notebook se llevan acabo los 3 incisos del primer ejercicio

```
library(readr)

library(dplyr)
library(lubridate) #Fechas y horas
library(tidyr) #spread
#graficas
library(ggplot2)
library(gridExtra)

library(tseries)

#cluster
library(animation)
library(factoextra)

#test
library(funtimes)
```

Funciones

```
#Prueba para tendencia en series de tiempo.
test_tend_lin<-function(dataset){</pre>
  p_values<-NULL</pre>
  ar_order<-NULL
  ar_coef<-NULL
  for(i in 1:ncol(dataset)){
    #print(i)
    dat_ts<-ts(dataset[,i]) #seleccionar serie</pre>
    aux<-notrend_test(dat_ts) #Prueba tendencia</pre>
    p_values<-c(p_values,aux$p.value) #Obtener valor p</pre>
    ar_order<-c(ar_order,aux[["estimate"]][["AR_order"]]) #Obtener AR_order</pre>
    ar_coef<-c(ar_coef,mean(aux[["estimate"]][["AR_coefficients"]])) #Obtener phi
  final_v<-list(p_values,ar_order,ar_coef) #lista con todos los valores obtenidos</pre>
  final_v<- as.data.frame(final_v) #convertir a df</pre>
  names(final_v)<-c("p_values","AR_order","AR_coef")</pre>
  final_v$Estacion<- colnames(dataset) # Agregar n??mero de estaci??n
  return(final_v)
}
```

Obtener datos

```
dataset <- read_csv("csv_files/dataset.csv")
#cambiar nome de columna, fecha Arribo por facilidad de manejo
names(dataset)[names(dataset) == 'Fecha Arribo'] <-'Fecha_Arribo'</pre>
```

1.1 ??En qu?? horarios hay mayor afluencia y en qu?? estaciones?

Afluencia en retiros(horarios).

```
#Crear variable de hora de retiro como factor y variable de dia de la semana

Gr??ficas de afluencia por horarios

g4

```
#Unir datos de afluencia
horas<-rbind(d2,e2)

#Gr??fica de afluencia por horas
g4<-ggplot(horas, aes(x=as.factor(Hora), y=n, fill=variable)) +geom_bar(stat='identity', position='dodg

#Gr??fica de afluecia de Retiros por d??a/Hora
f1<-ggplot(e1,aes(x=Hora_Retiro_fac, y=n, color=Dia_Retiro))+ geom_point(aes(group= Dia_Retiro)) +geom_

#Gr??fica de afluecia de Arribos por d??a/Hora
g1<-ggplot(d1,aes(x=HoraArribo_fac, y=n, color=DiaArribo))+ geom_point(aes(group= DiaArribo)) +geom_line
```

De la gr??
fica podemos notar que las horas pico de Retiro son a las 18:00,14:00,15:00 y 13:00 horas mientras que para arribos son las 14:00,18:00,15:00 y 19:00 horas. Las horas pico parecen ser horarios de comida o salida de trabajo.

grid.arrange(f1,g1)

Los d??as de lunes a Viernes tienen un comportamiento similar, mientras que para sabado y domingo, las horas pico de retiro son entre 12:00, 14:00 hrs mientras que para arribo son a las 13:00, 14:00 hrs

??En qu?? estaciones hay mayor afluencia de Retiros?

Afluencia en estaciones para retiros

```
scale_fill_gradient(low = "white", high = "steelblue") +
ylab("Dia_Retiro") +
xlab("Ciclo_estacion") +
theme_bw() +
labs(fill = "n") +ggtitle("Afluencia en estaciones de Retiro por hora", subtitle = "Estaciones ordenad")
```

Afluencia en estaciones para arribos

```
#Contar usuarios en estaci??n arribo
Arribo_count<-dplyr::count(dataset, Ciclo_EstacionArribo, sort = TRUE)</pre>
#seleccionamos las 10 estaciones con m??s arribos
Arribo_count<-head(Arribo_count,10)$Ciclo_EstacionArribo
#Obtener datos de esas estaciones
Arribo_popular<-dataset %>% filter(Ciclo_EstacionArribo %in% Arribo_count)
#Conteos por grupos
Arribo_popular <- Arribo_popular %% count(Ciclo_EstacionArribo, HoraArribo_fac)
#Convertir valor a factor, ordenar por estaciones con mayor afluencia
Arribo_popular$Ciclo_EstacionArribo<-factor(Arribo_popular$Ciclo_EstacionArribo, levels =Arribo_count)
#Graficar
g3<-ggplot(Arribo_popular, aes( as.factor(Ciclo_EstacionArribo), HoraArribo_fac)) +
  geom_tile(aes(fill = n), color = "blue") +
  scale_fill_gradient(low = "white", high = "steelblue") +
 ylab("DiaArribo") +
  xlab("Ciclo_estacion") +
  theme_bw() +
  labs(fill = "n") +ggtitle("Afluencia en estaciones de arribo por hora", subtitle = "Estaciones ordenad
```

??En qu?? horarios hay mayor afluencia y en qu?? estaciones?

f3

Afluencia en estaciones de Retiro por hora

Estaciones ordenadas de mayor a menor afluencia

g3

Afluencia en estaciones de arribo por hora

Estaciones ordenadas de mayor a menor afluencia

Se nota una mayor afluencia de arribo por las tardes, recordando la gr??fica de retiros, la estaci??n 271 en particular tiene muchos retiros por las ma??anas y arribos por las tardes. La mayor??a de estaciones consideradas son populares tanto en retiros como en arribos.

1.2. Perfiles de uso de las estaciones.

Empezaremos por un an??lisis exploratorio

```
#Verificar las estaciones que tenemos
dataset%>%
    distinct(Ciclo_Estacion_Retiro) %>%
    count()
## # A tibble: 1 x 1
##
##
     <int>
## 1
       475
dataset%>%
    distinct(Ciclo_EstacionArribo) %>%
    count()
## # A tibble: 1 x 1
##
         n
```

```
## <int>
```

```
# De dond?? retiran las bicis y a dond?? llegan
bike_use_path <- dataset%>%
   group_by(Ciclo_Estacion_Retiro, Ciclo_EstacionArribo) %>%
   count() %>%
   ungroup()
#De que estaciones retiran m??s bicis
bike_use_retiro <- dataset%>%
   group_by(Ciclo_Estacion_Retiro) %>%
    count() %>%
   ungroup() %>%
   arrange(-n)
#A qu?? estaciones arriban m??s bicis
bike_use_arribo <- dataset%>%
   group_by(Ciclo_EstacionArribo) %>%
   count() %>%
   ungroup() %>%
   arrange(-n)
```

Estaciones m??s y menos concurridas retiros

Selecting by n

```
ylab('id de estaci??n') +
    ggtitle('Estaciones menos concurridas (retiro)')

## Selecting by n

grid.arrange(bu2, cu2, ncol = 2)
```

Estaciones m??s y menos concurridas arribos

Selecting by n

Selecting by n

```
grid.arrange(bu1, cu1, ncol = 2)
```

```
hora_retiro_decimal = hms(Hora_Retiro) %>% as.numeric() %>% round(0) / 3600,
           hora_retiro_decimal = hora_retiro_decimal %>% round(0))

```

Estos 3 perfiles ya cuenta con carateristicas diferentes de otro grupo pero similares dentro del mismo grupo. Esta segmentaci??n basicamente define perfiles en base a arribos y retiros, por lo que puede ser util para determinar la cantidad de bicicletas que deben tener en esas estaciones. Otra posible interesante agrupacion se puede hacer tomando en cuenta la variable de tiempos de uso, proporci??n de uso en fines de semana.

1.3. Tendencia en estaciones

??En qu?? estaciones puedes observar una tendencia de uso a la alta?

```
#Vamos a considerar el uso total(arribos/retiros) de cada estaci??n por d??a
#contar arribos
a1<- dataset %>% select("Ciclo_EstacionArribo", "Fecha_Arribo")
a1<-as.data.frame(table(a1))
names(a1)<- c("Estacion", "t", "n")

#contar retiros
a2<- dataset %>% select("Ciclo_Estacion_Retiro", "Fecha_Arribo")
a2<-as.data.frame(table(a2))
names(a2)<- c("Estacion", "t", "n")

#Unir arribos y retiros
uso_df<-merge(x=a1,y=a2,by=c("Estacion", "t"),all=TRUE)
#Replace nan's with 0'
uso_df[is.na(uso_df)] <- 0
#print(sum(is.na(a)))</pre>
```

```
uso_df$n.- uso_df$n.x+uso_df$n.y
uso_df<-uso_df[,c("t","Estacion", "n")]

#regresar t a date
uso_df$t<-as.Date(uso_df$t, format= "%Y-%m-%d")

#Dejar solo datos despu??s de Agosto, podr??amos tener retiros en fechas anteriores
uso_df<-uso_df %>% filter(t>=as_date("2021-08-01") & t<=as_date("2021-10-31"))</pre>
```

Recordando que: El modelo de un proceso autorregresivo dice que en el momento t el valor Y_t , consiste de una, δ (delta), m??s un coeficiente autorregresivo, ϕ (phi), por el valor del dato anterior (Y_t - 1), m??s el ruido aleatorio, ??tc. La idea es tomar ϕ , medida de cambio, para verificar que tanto aumenta o disminuye la tendencia.

Primero haremos pruebas de existencia de tendencia

```
#Convertir cada estaci??n en una columna
uso_df_sp<-spread(uso_df,key = Estacion,value = n)
uso_df_sp[is.na(uso_df_sp)]<-0

#HO: No existe tendecia
#H1: Tendencia lineal
#Asumiendo que las series temporales pueden estar autocorrelacionadas, aplicamos la versi??n sieve-boot

#Prueba de tendencia en series de tiempo
uso_df_ten<-test_tend_lin(uso_df_sp[,2:ncol(uso_df_sp)])

#agregar varible de estaciones
uso_df_ten$Estacion<-colnames(uso_df_sp[,2:ncol(uso_df_sp)])</pre>
```

Vamos a seleccionar solo las variables para las que podemos rechazar la hip??
tesis nula de ausencia de tendencia a un nivel de confianza de
l95%

```
uso_df_ten_sig<-uso_df_ten %>% filter(p_values<=.05)

#Obtenemos las 10 con mayor proporci??n de cambio
tend_alta<-uso_df_ten %>% arrange(desc(AR_coef)) %>% head(10)
cat("Estaciones con tendencia a la alta:",tend_alta$Estacion)
```

Estaciones con tendencia a la alta: 292 55 159 29 52 43 130 121 337 57

```
#Obtenemos las 10 con menor proporci??n de cambio
tend_baja<-uso_df_ten%>% arrange(AR_coef) %>% head(10)
cat("Estaciones con tendencia a la baja:",tend_baja$Estacion)
```

Estaciones con tendencia a la baja: 273 176 274 439 255 13 455 371 442 334

Gr??ficas variables finales

#Gr??fica de estaciones con tendencia a la alta uso_ten_alta<-uso_df %>% filter(Estacion %in% tend_alta\$Estacion) ggplot(uso_ten_alta,aes(x=t,y=n,group=Estacion)) + geom_line()+ facet_wrap(~ Estacion)

#Gr??fica de estaciones con tendencia a la baja
uso_ten_baja<-uso_df %>% filter(Estacion %in% tend_baja\$Estacion)
ggplot(uso_ten_baja,aes(x=t,y=n,group=Estacion)) + geom_line()+ facet_wrap(~ Estacion)
